

FIXMapper allows connections to several **FIX** sources and destinations. In fact, the interface is configurable for many simultaneous connections to clients or broker together. **FIXMapper** also supports optional fields which can be used individually and adapted to the needs of the client/broker. The field mapping permits individual adjustments without cost-intensive third party software development.

FIXMapper supports **FIX** version from 4.0 to 4.4. **FIXMapper** also permits a standard way to communicate with bank systems. Many bank systems have already a **FIX** interface. By connecting this interfaces to **FIXMapper**, our product will manage all external **FIX** connections. The **FIXMapper** itself can interface many client/broker systems. The easy handling makes possible individual configuration in short time. The entire **FIXMapper** system can be monitored and managed with a GUI application.

- FIXMapper Module
- FIX Adapter
- MS Queuesystem
- Thirdparty system
- Order for Broker A
- Order for Broker B
-

FIXMapper is not only configurable on field mapping level, but allows message mapping for certain messages too. In practice, it is possible to connect hosts and clients using **FIX** version 4.0 with brokers running **FIX** version 4.2. The running costs for adjustments are kept to a minimum.
